

STEMlab 122.88-16 SDR (Red Pitaya 16-bit)

All the measurements were done using PowerSDR mRX PS v3.4.9 and the firmware by Pavel Demin.

One small modification was done by changing the position of the jumper connected to the SENSE pin of the ADC chip. After this modification, the ADC input range is set to 2 V peak-to-peak.

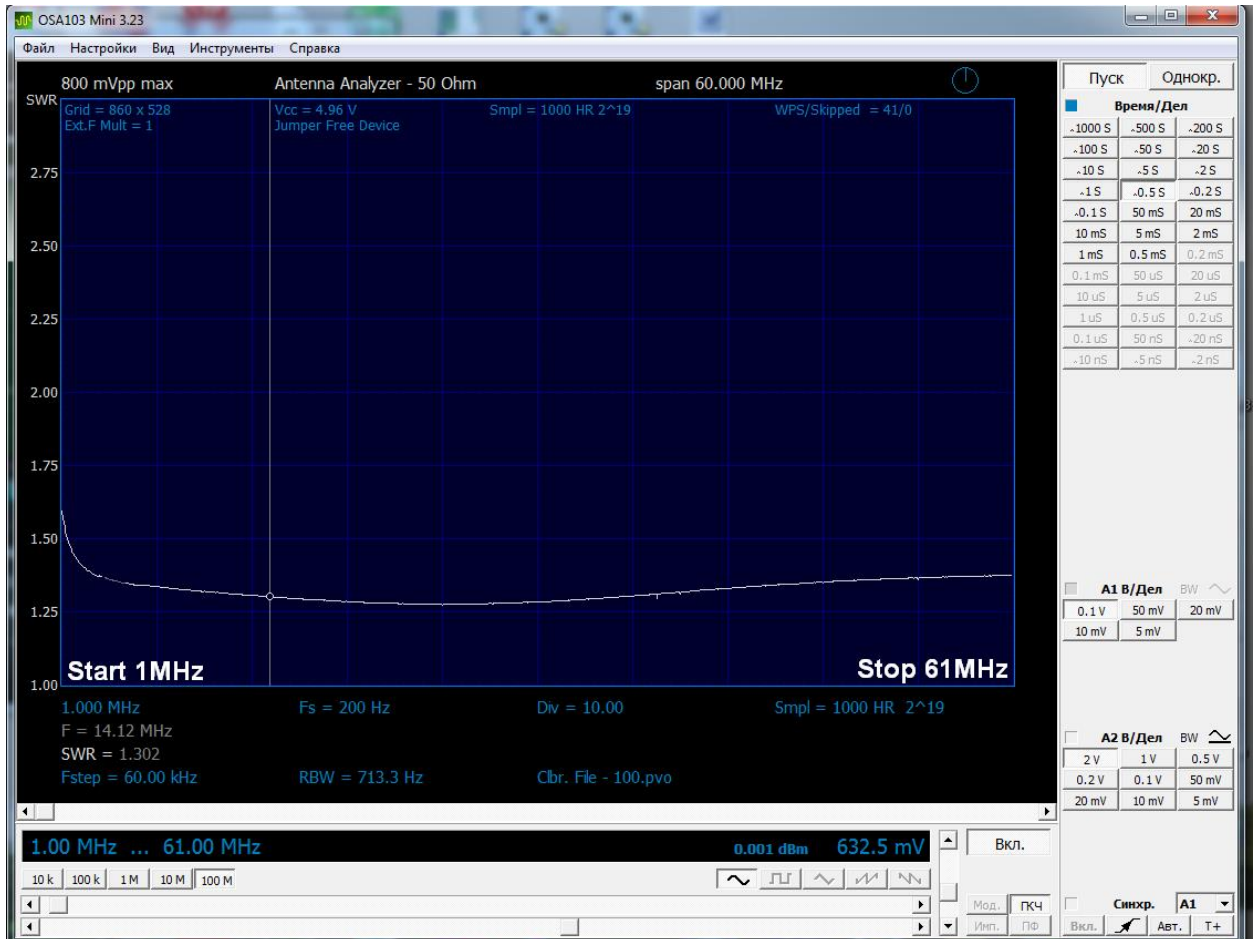

After this modification, the dynamic range is increased by 6 dB, the sensitivity does not change.

SENSE, Vpp	1	2
MDS, dBm	-124	-124
DR, dB	121	127

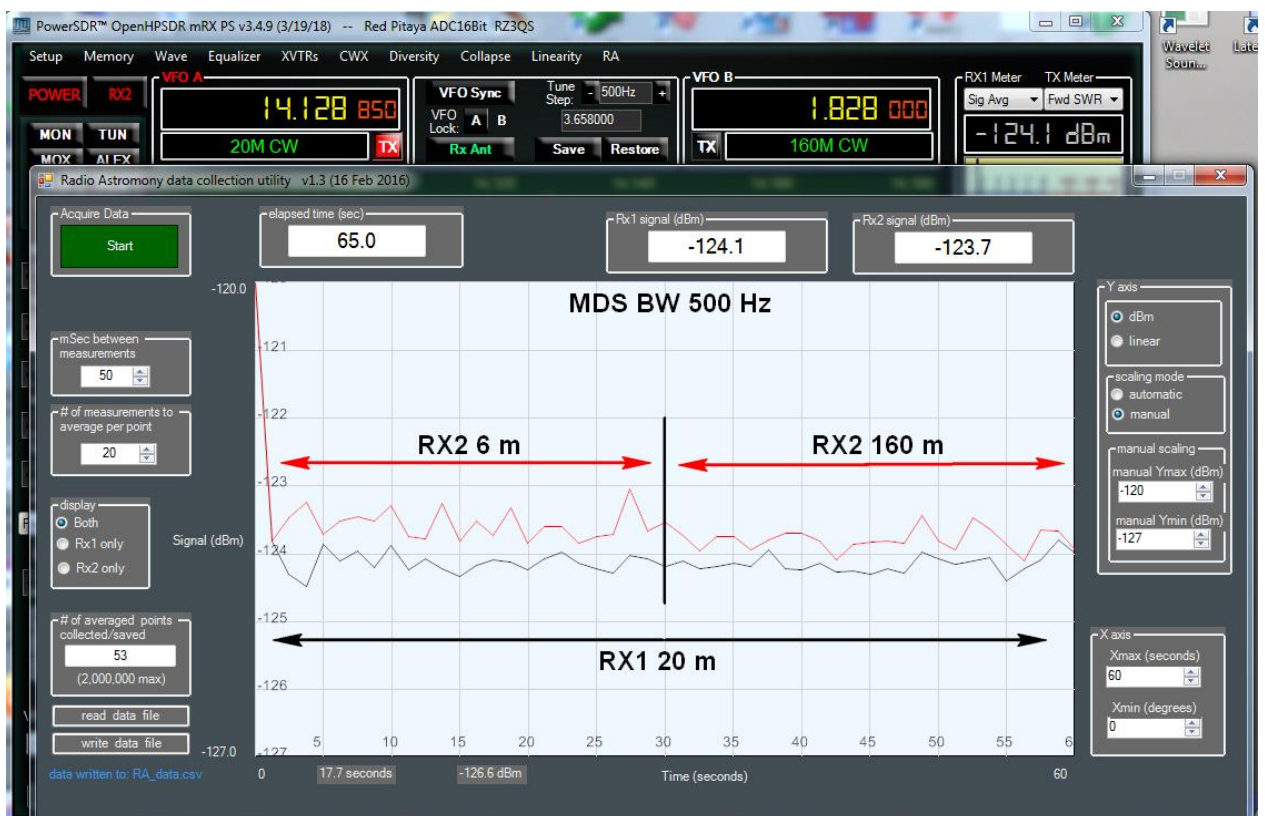

The receiver is based on a dual channel ADC (LTC2185).

SWR at the RF inputs is around 1.3 over the HF range.

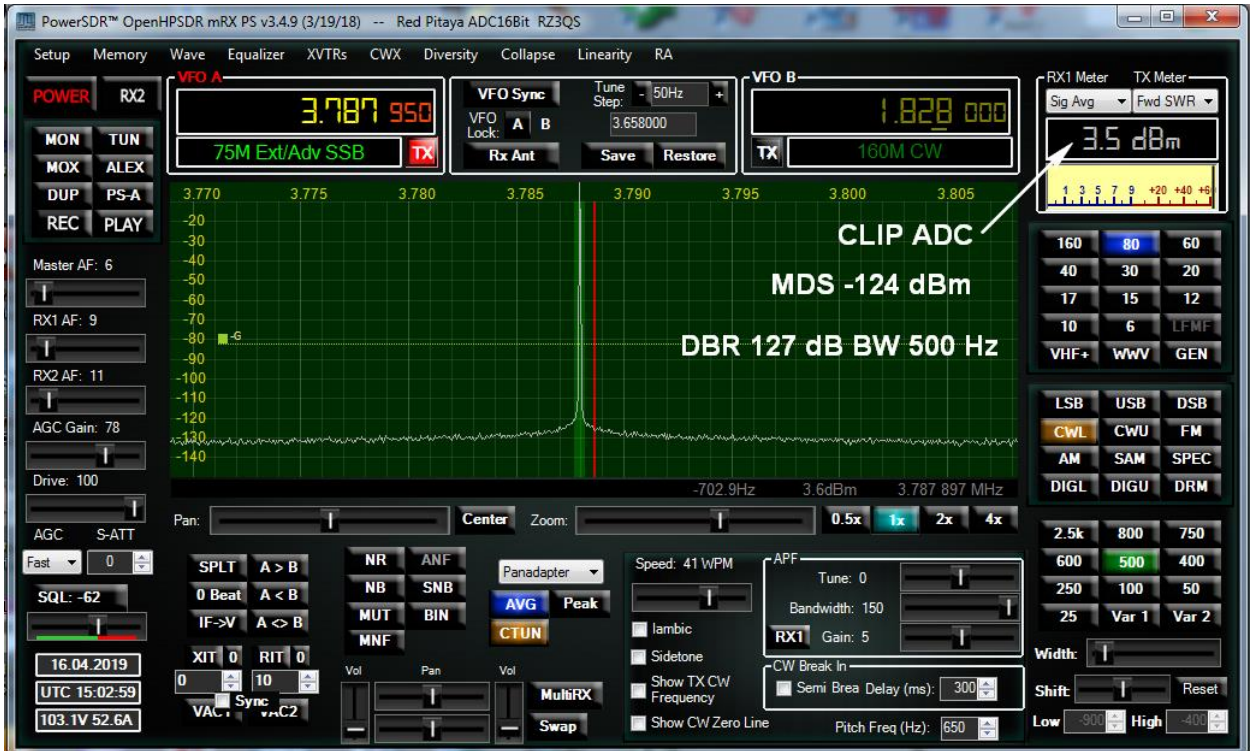

Noise floor in the 500 Hz band is -124 dBm.

The variation of the noise floor over the HF range is minimal.

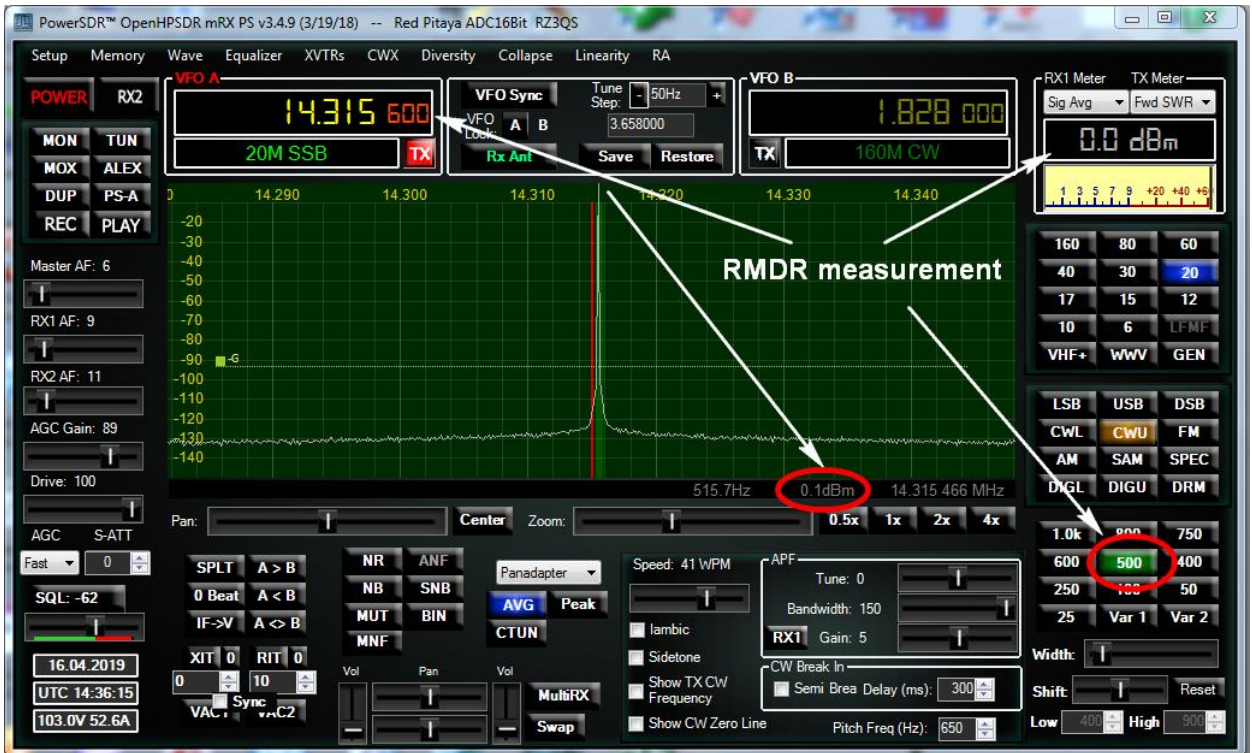

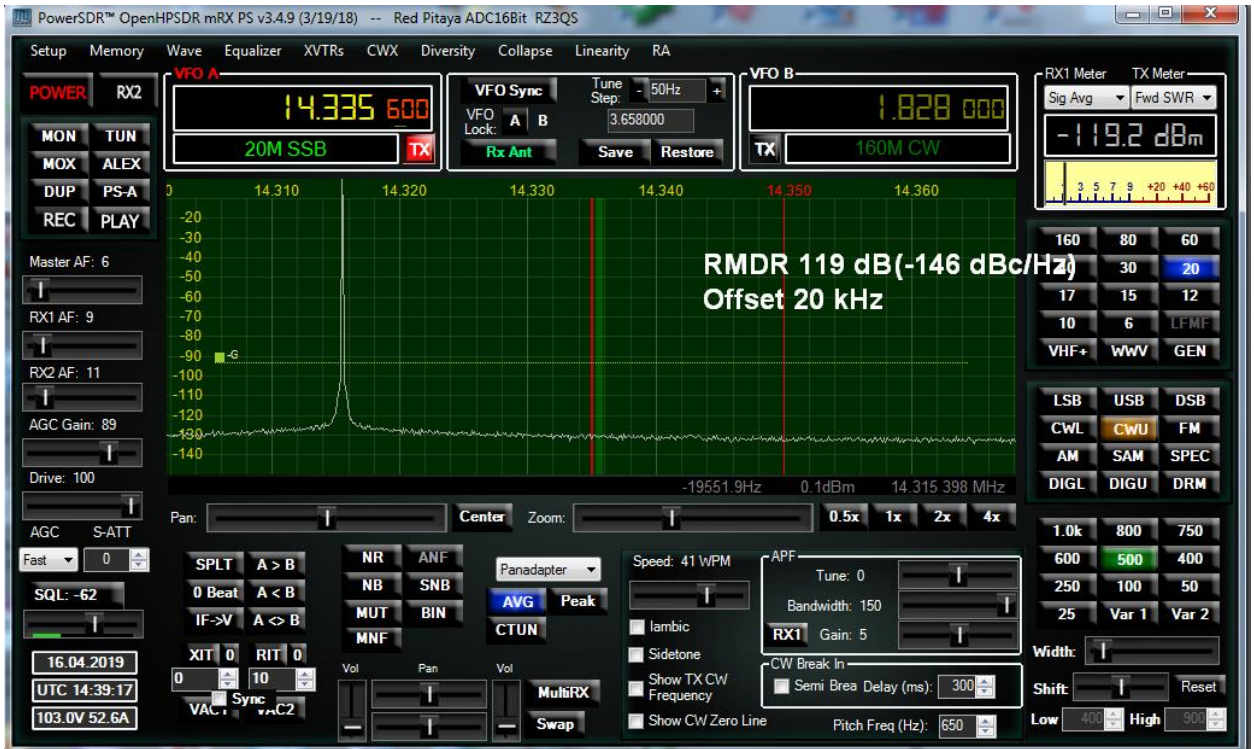

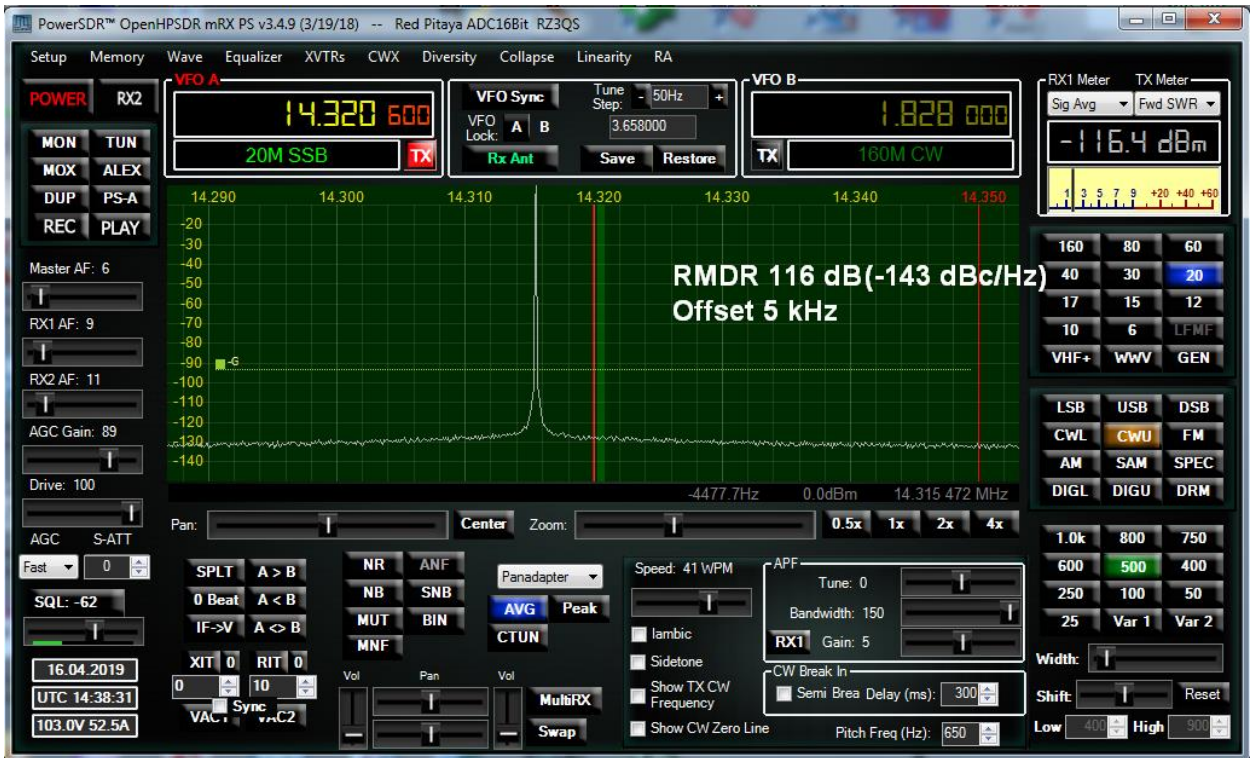

Blocking dynamic range (BDR).

Reciprocal mixing dynamic range (RMDR).

Measured 2, 5, 20 kHz from an unmodulated carrier.

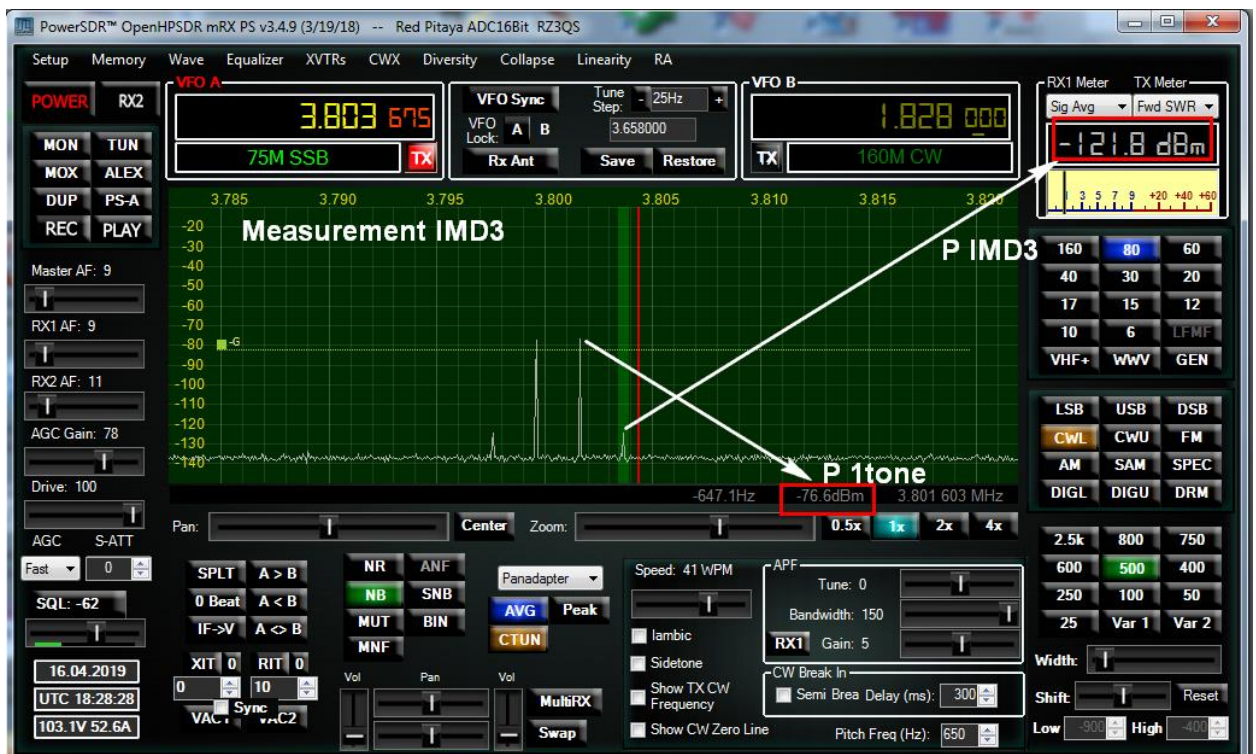

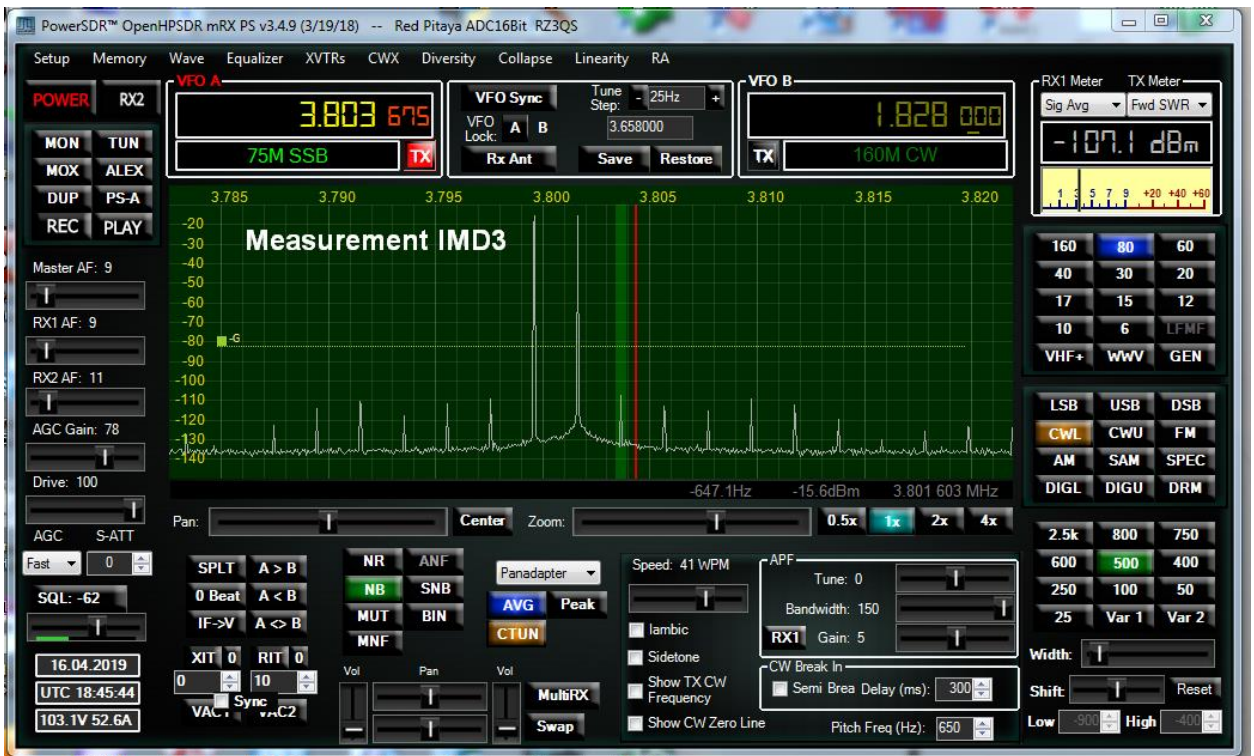

Two-tone third-order intermodulation distortion (IMD3).

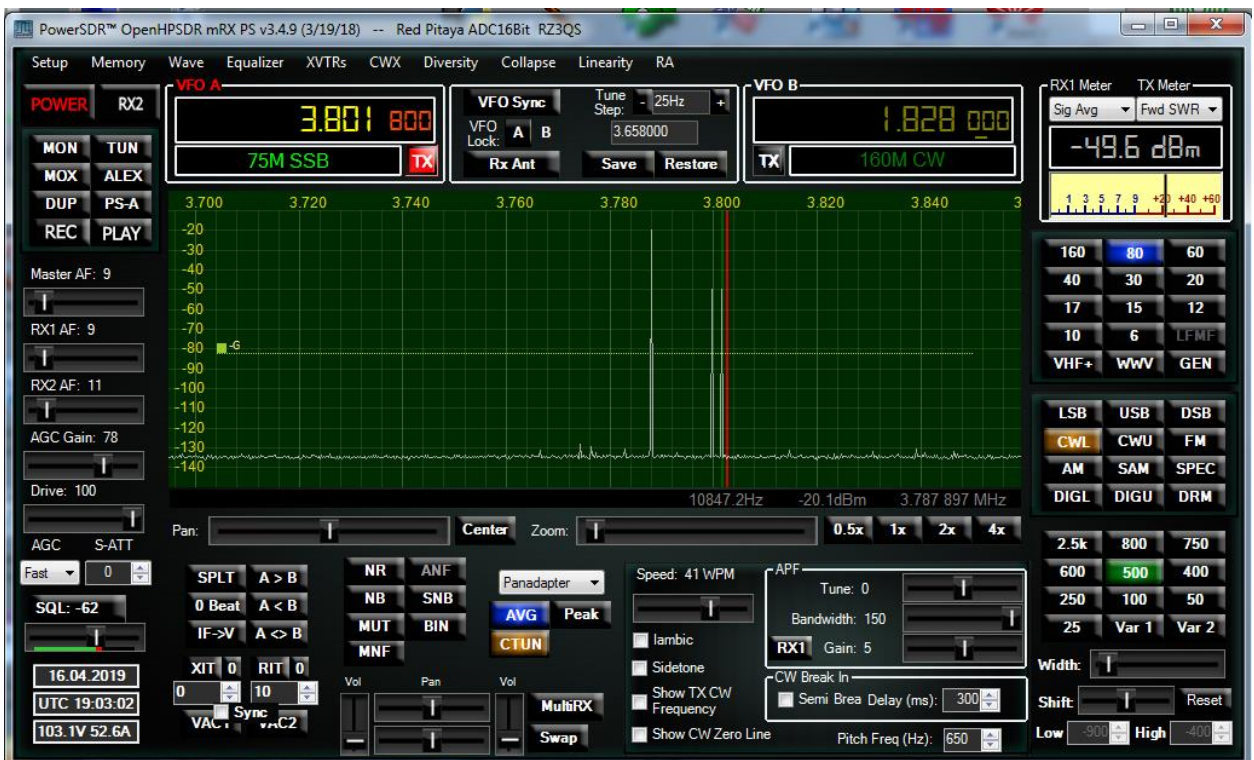

The following table shows the results of measurements carried out at the power levels of two tones in the range from -76 dBm to -4 dBm with a step of 6 dBm.

P 1 tone, dBm	P IMD3, dBm	IMD3, dBc
-76	-121	45
-70	-118	48
-64	-120	56
-58	-123	65
-52	-122	70
-46	-113	67
-40	-112	66
-34	-115	81
-28	-108	80
-22	-108	86
-16	-107	91
-10	-95	85
-4	-80	76

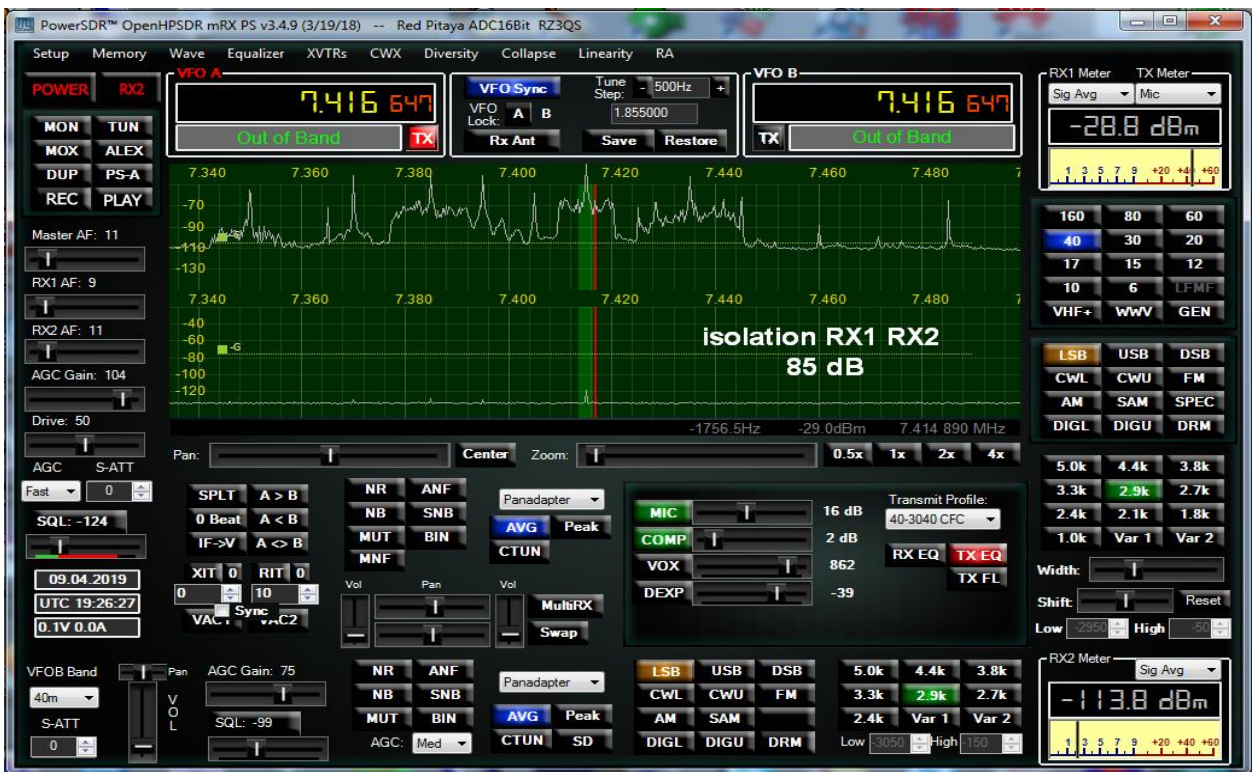

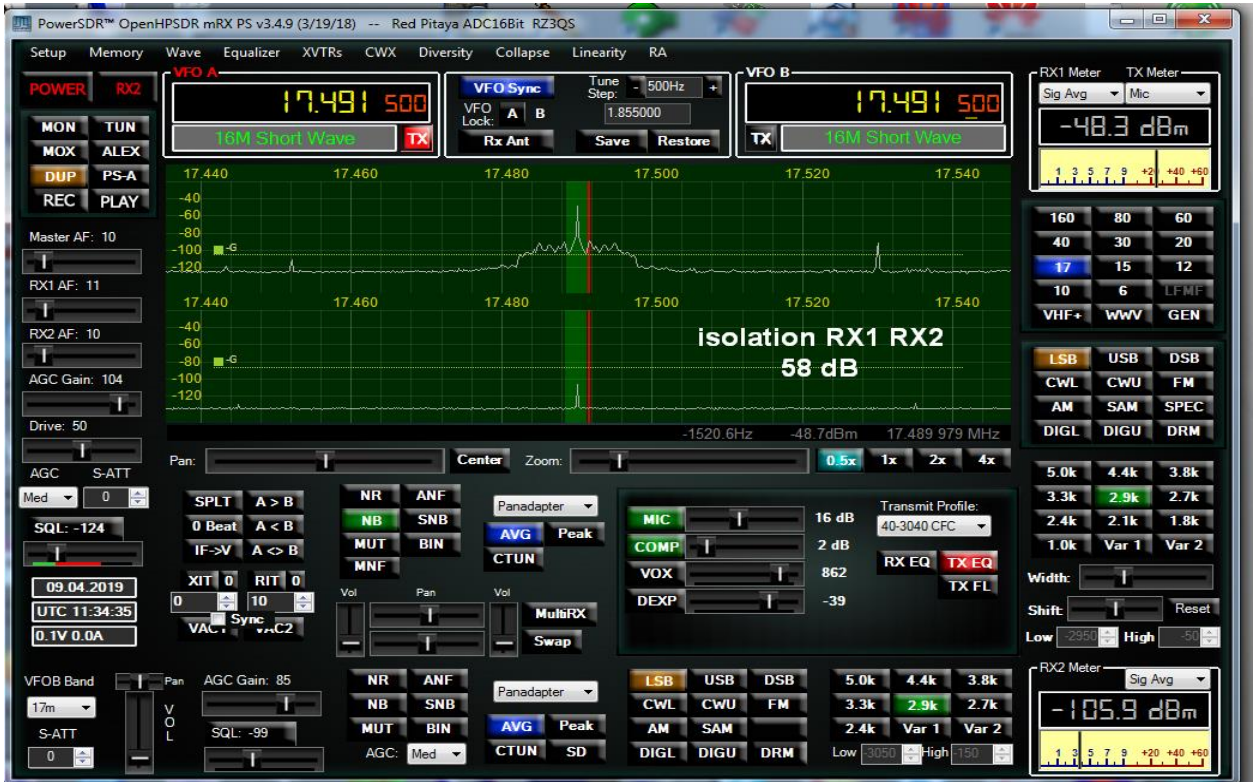

In the real signal from the antenna there are noises and signals from various stations. The presence of the noise in the signal from the antenna smooths the ADC transfer function and reduces the signal distortion caused by the digitization. This effect can be illustrated by adding a third tone to the two-tone test signal.

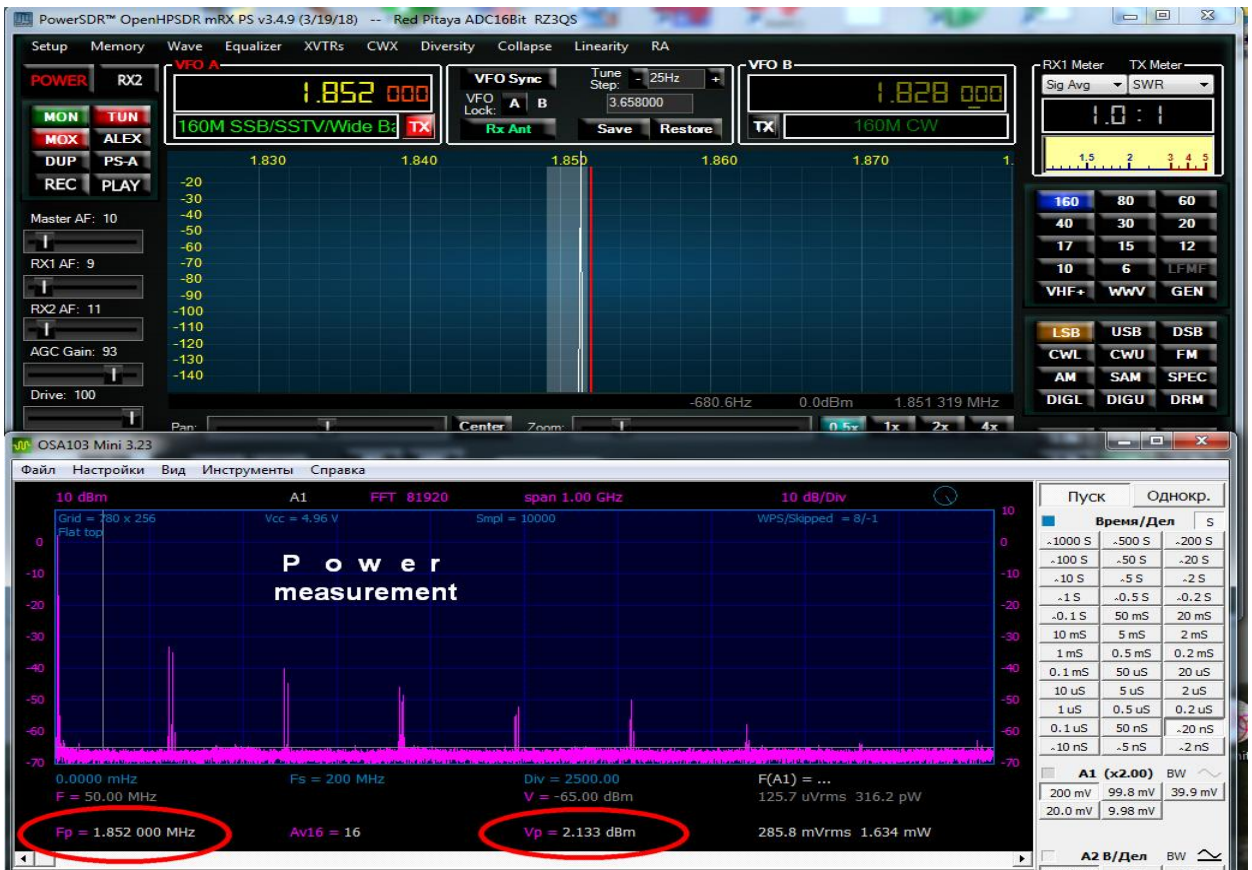

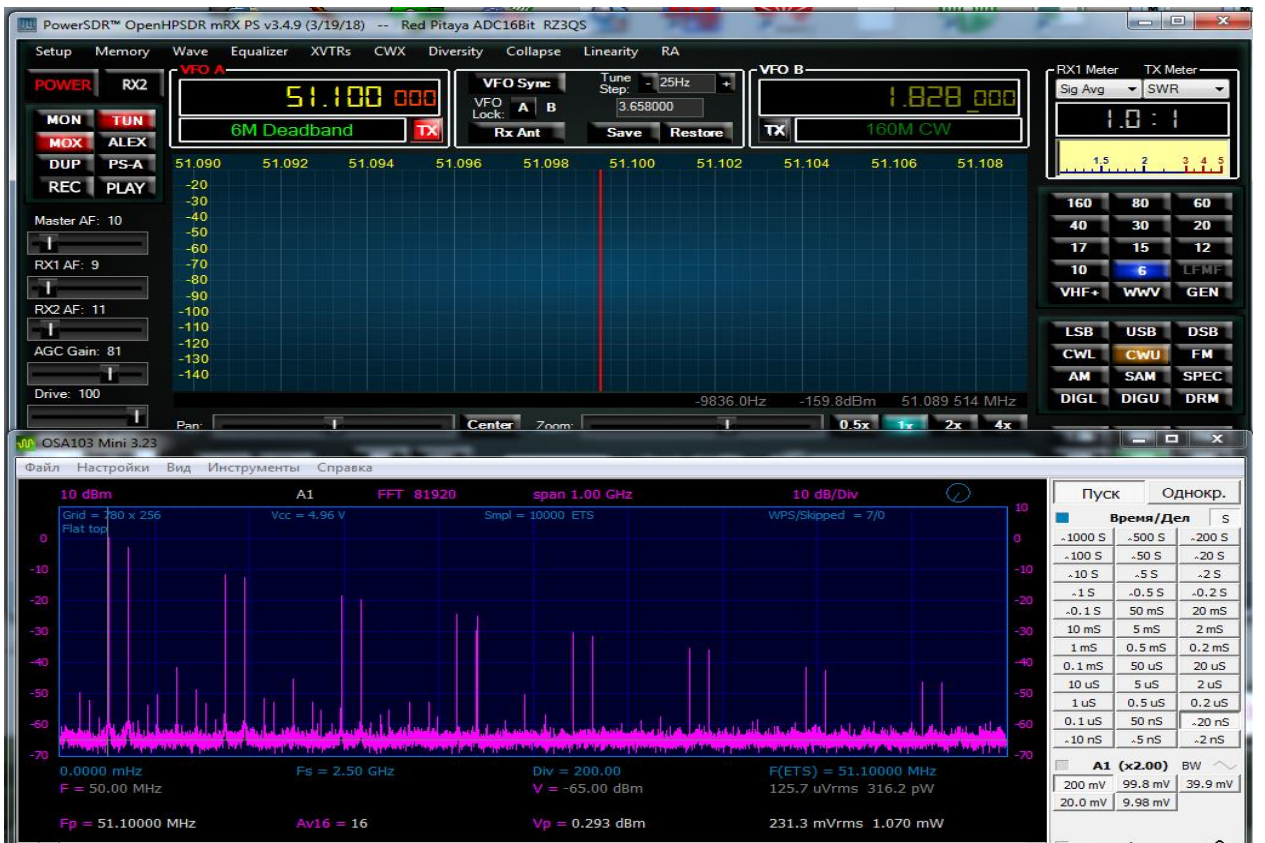

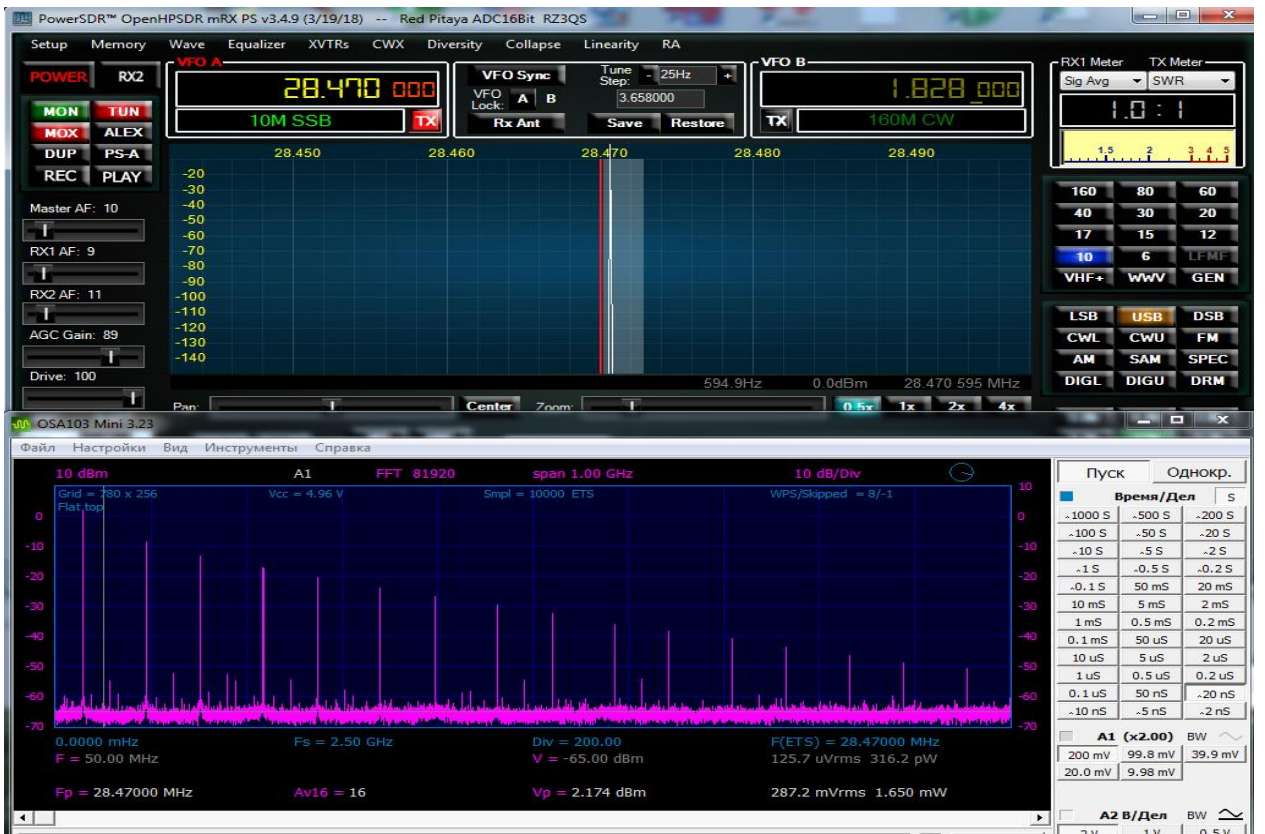

Crosstalk between IN1 and IN2.

IN1 is connected to an antenna. IN2 is connected to a 50 Ohm terminator.

Output signal level.

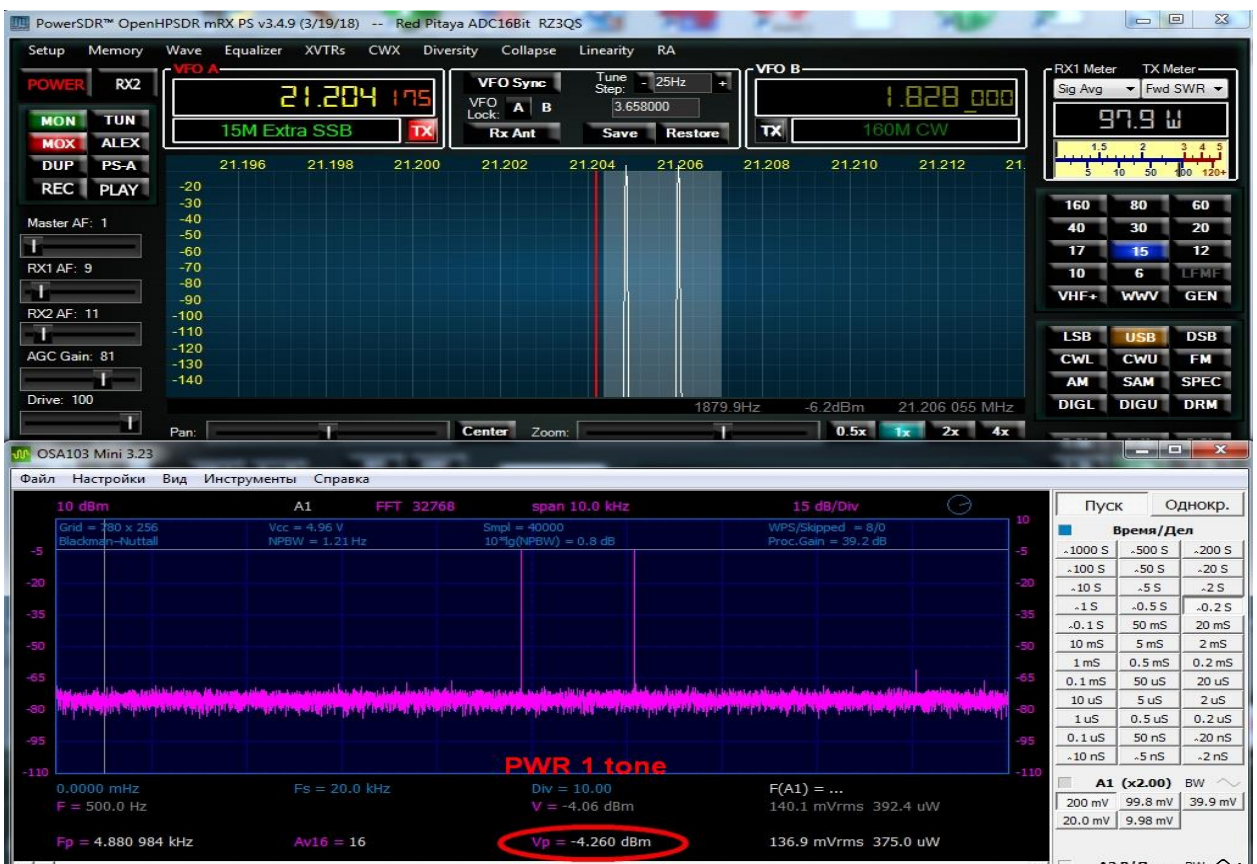

Transmitter IMD3.

Peak envelope power (PEP) is 2 dBm.

OSA103 mini shows the power of one tone.

Transmitter IMD3 precisely measured using PowerSDR mRX PS.

The transmitter signal is connected to IN2.

Transmitter IMD3 is 68 dBc.
